

# 5 **React** Mistake You Should Avoid

*and how to fix them*

# Misusing the Key Prop

Using indexes as keys in lists can lead to performance issues and bugs, especially if the list can change.

```
{myList.map((item, index) => <div key={index}>{item}</div>)}
```

```
{myList.map(item => <div key={item.id}>{item.name}</div>)}
```

# Overusing State

Putting all data into state, even if it doesn't change, can lead to unnecessary re-renders and complexity.

```
function MyComponent() {  
  const [value, setValue] = useState(0);  
  // Doesn't change  
  return <div>{value}</div>;  
}
```

```
function MyComponent({ value }) {  
  return <div>{value}</div>;  
}
```

## Not Utilizing useEffect Correctly

Forgetting to specify dependencies for useEffect can lead to unexpected behavior or infinite loops.

Always specify a dependency array, even if it's empty, to control when the effect runs.

```
useEffect(() => {  
  fetchData();  
}, []);
```

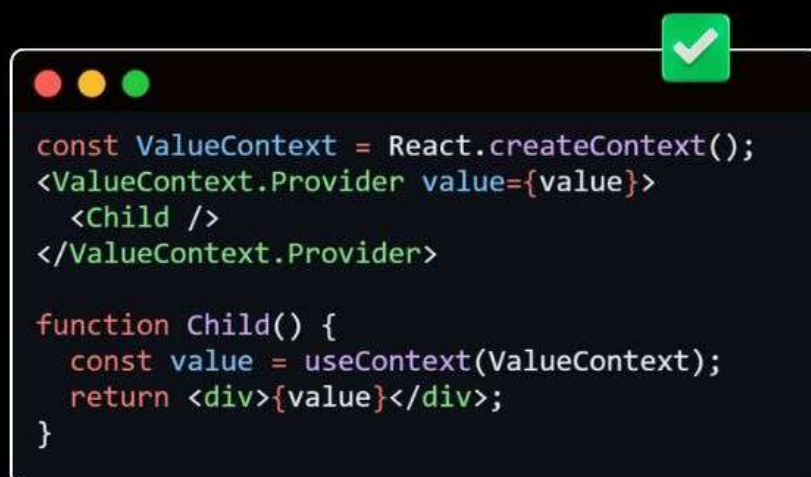

# Prop Drilling

Passing props through multiple layers of components makes the code hard to maintain.

```
<Grandparent>
  <Parent>
    <Child prop={value} />
  </Parent>
</Grandparent>
```

```
const ValueContext = React.createContext();
<ValueContext.Provider value={value}>
  <Child />
</ValueContext.Provider>

function Child() {
  const value = useContext(ValueContext);
  return <div>{value}</div>;
}
```

# Ignoring Composition

Creating components with a single, inflexible structure rather than making them reusable.

```
function UserProfile({ user }) {  
  return (  
    <div>  
      <Avatar src={user.avatar} />  
      <Username name={user.name} />  
      {/* More user details */}  
    </div>  
  );  
}
```

```
function UserProfile({ children }) {  
  return <div>{children}</div>;  
}  
  
<UserProfile>  
  <Avatar src={user.avatar} />  
  <Username name={user.name} />  
  {/* More user details or different layout */}  
</UserProfile>
```
